BUSINESS CONTINUITY FOR YOUR COMPANY
The goal is to strengthen the company and especially the employees even in major and unexpected crises and to make them more resilient. In crises, decisions and actions are required which are different from usual business, but can give you a clear lead in overcoming a crisis and decide whether your company will go through it strong or weak and secondly come out of it stronger or weaker than before.

The better a company’s team is prepared for a crisis, the greater the chance that the company will emerge more quickly and remain capable of action in the crisis.

Failing to plan is planning to fail
Implementation of Business Continuity for the company

What are your main, best selling products?

Ensure availability and delivery of the products. Where are your products developed and produced?

How long can the crisis last?
Calculate with a maximum of crisis time to be on the safe side. Also calculate the length of a crisis which makes it impossible for your company to recover. Allow for a good period of time for disaster recovery - that is, a time to get well.

Go through your risk management again, step by step.
Develop multi-level plans for different types of crises (create several plans for different scenarios) Identifying, Evaluating, Recording, Response

Develop a strategic plan

What strategies does the company need to remain active in the crisis? What activities will be maintained during the crisis? Is there a backup equipment (laptop, phones, remote server, stock items, ) Can the team cover all key activities?

Develop a crisis - businessplan

How to adapt the business plan to the emergency situation Calculate the costs so that you can continue your business Questions such as - what is necessary in the crisis or where savings have to be made. What costs do you have to give the company also the time of recovery
Implementation of Business Continuity for your employees

Your team is your company
Your company lives from your employees and your team makes the difference whether your company is successful or not. Does your team enjoy their work or do they not enjoy their work and come to work with „stomach ache“ - that makes the difference between success and failure.

Protect your employees and habits
Ensure the necessary peace and quiet for yourself and your team.

A ship can steer through wild seas if the captain has the steering wheel safely in his hands and each crewmember knows what to do.

To run a company well, you need a great team. Your team is the basis for implementing BC, because your team knows the daily processes and interactions in the company.

Also try to use the skills and capacities of your team and define the role in times of crisis and also the responsibilities.

Inform about possible stumbling blocks and inspire your team.

Define a future perspective and a goal after the crisis.

Make clear and precise decisions in a crisis.

.... a good teamspirit is a helpful companion in a crisis.
Form a good, resilient BC team where the skills are clear

What division of tasks do we have in the team

Who is responsible for what

Who leads the crisis communication in the company - internally and externally

Who provides the technical infrastructure? (remote workstations, telephones, servers etc) Is the team able to work if the building, or office is destroyed?

Is there a contact address where delivery can be made if the building/office is not in working order.

Who is responsible in the team for ensuring that all data is regularly backed up outside the company.

Develop a good plan with your team to ensure communication with your customers and business partners.

....common sense is not so common
Voltaire, Philosopher
Personal experience

When I was young, I had a job in a big bank. During our technical training, which of course took place with the latest IT equipment and the bank was also well equipped, there was a big topic of how NOTOR works in the bank. NOTOR stood for emergency organization and here all procedures and processes, which usually took place on the computer, had to be organized by hand and had to be learned. At that time it was completely incomprehensible and old-fashioned for me that procedures that are easy going on the computer, had to be learned by heart to keep the operation going in an emergency. Today I know why! Because with a good plan, the operation of the company can be continued reasonably well even in times of crisis.
